SUBJECT: AIR FILTER, P/N 69922

Air Filter, P/N 69922, is a green, flocked-type air filter which has been used in production of various Mac 10 series engines for some months. The manufacturer recently changed his method of applying the flocking material which has resulted in some filters which restrict air flow.

The basic appearance of good and bad filters is so close it is difficult to determine a good one from one that will restrict air flow.

The following checks will show whether or not an air filter is restricting air flow:

1. With a restricted air filter installed high and low speed fuel adjustments must be leaned out drastically to obtain good operation.

2. With the filter removed the high and low speed fuel adjustments can be set near normal (approximately 1 turn open) and good operation is obtained.

If installation and removal of a filter causes the reactions in both 1 and 2 preceding, it is restricting air flow and obviously should not be used.

New green, flocked-type air filters, P/N 69922, that are found to restrict air flow should be returned to your distributor for replacement. A warranty claim should be submitted with the filter.
