SUBJECT: VALVE WRENCH

If a socket wrench of the proper size is not readily available for use in the removal or installation of the compression release valve (DSP), on saws equipped with the valve, a suitable wrench can be made with the Scrench, P/N 68648.

1. Grind off the weld metal attaching the screwdriver.
2. Drive the screwdriver out of the socket section.
3. Clean up the socket section with a round file to remove burrs and rough edges.

This section may then be used as an ordinary socket wrench of the proper size and length.
