SUBJECT: CARBURETOR HIGH SPEED JETS

Some SDC fixed high speed jet carburetors are now being manufactured with a sealing washer under the jet to improve seating of the jet in the carburetor body.

When required, the washer will be furnished with the jet and must be installed with it. Jets furnished without the washer do not need it.

The jets with washers are identified by the letter "J" on the face of the jet (with the jet number) as shown.

Before installing a new jet for service replacement or to compensate for a change in altitude, check for and remove any washer used with the old jet being replaced.
